

Nagios
(server/client)

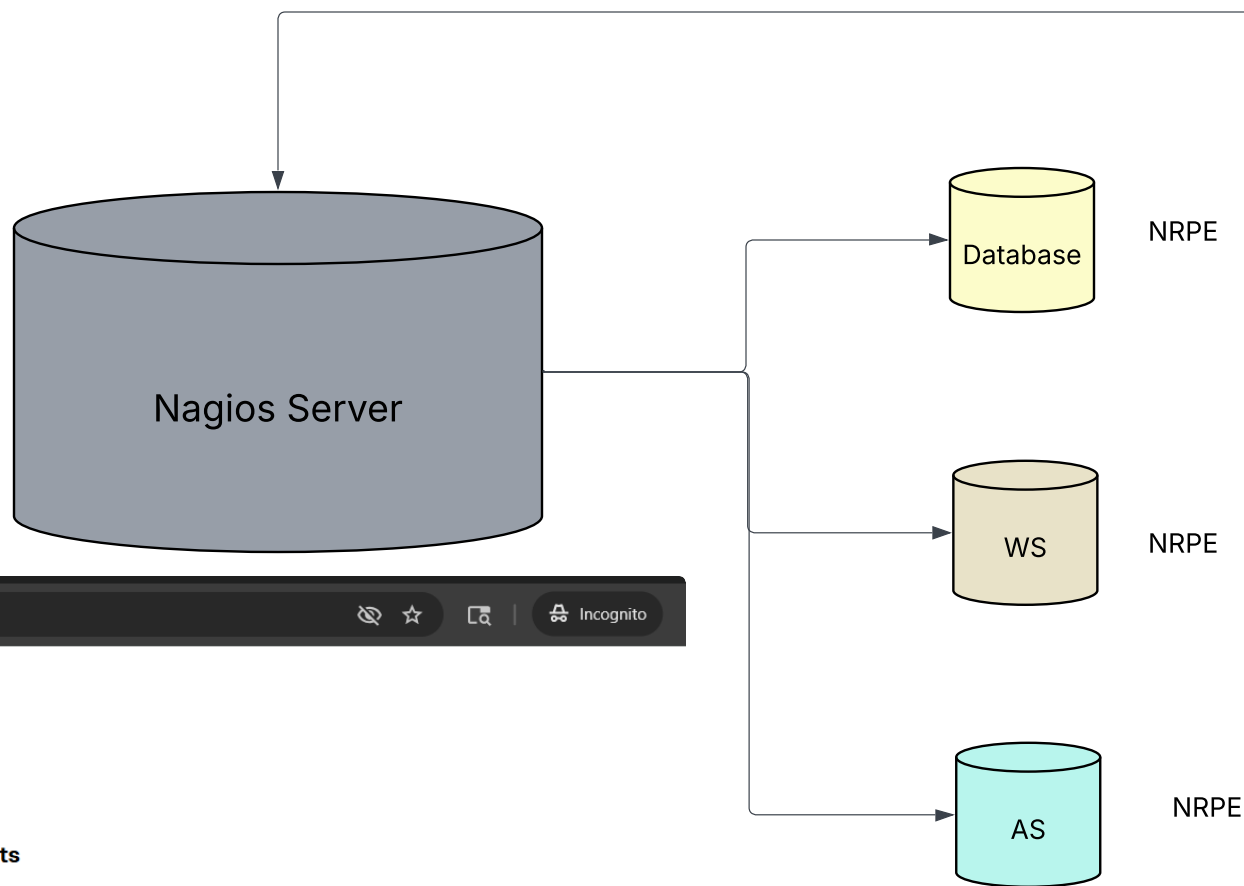

Diagram key

- is an open-source infrastructure monitoring tool used to monitor servers (CPU/RAM), network devices(NIC), applications, services, and system health in real time.
- Nagios helps detect issues before they become critical by providing alerts for downtime, high CPU/memory usage, failed services, network problems, and application failures. It improves uptime and system reliability.
- Nagios uses agents and plugins to check the status of hosts and services. It continuously polls systems and triggers alerts when thresholds or failures are detected.

Options to connect app to DB

- ☐ Inject all DB creds in application hardcoded
- ☐ Create another VM and stored my creds/secrets/keys/passwords and attach to app server
- ☐ Use key vault to store all your creds/secrets/passwords/certificates
